TITLE: Determination of nitrogen content in α -SiC by EPR technique

SOURCE: Zavodskaya laboratoriya, v. 31, no. 12, 1965, 1450-1451

TOPIC TAGS: silicon carbide, EPR, Hall effect, nitrogen, single crystal

ABSTRACT: An attempt was made to use EPR technique for determining nitrogen content in single crystals of hexagonal silicon carbide (α -SiC). The method is based on determining the number of paramagnetic centers (nitrogen atoms) in a crystal sample by comparing its EPR spectrum with the spectrum of a reference sample ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$). Both spectra were taken at the liquid nitrogen temperature with a PE 1301 radiospectrometer. The relationship between the concentration of the free charge carriers at room temperature as determined from the Hall effect (n_{Hall}) and the concentration of non-compensated and non-ionized nitrogen centers at the liquid nitrogen temperature (N_{EPR}) is:
 $N_{\text{EPR}} = 4.87 n_{\text{Hall}}$. All the experimental results obtained with silicon carbide samples

ABSTRACT: The above mentioned conference was called by the Geologo-Geographic Section of the USSR Academy of Sciences and other related institutions. It took place in Moscow and Leningrad from May 16th to June the 2nd 1958. About 500 persons, representing 144 organizations participated in the Congress with 220 reports being read. Representatives of the Peoples' Republics were as follows: Rumania - E. Lityanu; Bulgaria - Zh. Gybylov; Poland - Ya. Dylik; Czechoslovakia - V. Ambroz and K. Zhebera; Democratic Republic Germany - I. Gellert; Hungary - M. Kretsoy; and China - by Pey-Ven-Chzhun and Lyu-Tun-Shin, all professors.

TITLE: The Modernization of a Cantilever Milling Machine

PERIODICAL: Mashinostroitel', 1959, Nr 5, pp 16-17 (USSR)

ABSTRACT: The article contains information on the modernization of the Reineker "VF-2" milling machine at the Kolomenskiy teplovozostroitel'nyy zavod (Kolomna Diesel Locomotive Plant). The modernization consists in the following changes. The front spindle rest is supported by an adjustable roller bearing (Figure 1). A thrust bearing is used for taking up the axial thrust. The plain bearings in the speed box are replaced by roller bearings and these bearings are lubricated by oil, sprayed by special rings. The change gear design is altered (details given), etc. As a result, the work efficiency improved, the setting and maintenance time was reduced, the machining accuracy improved. There are 2 diagrams.

TITLE: Slot-type gas burner. Class 24, No. 183871

SOURCE: Izobret prom obraz tov zn, no. 14, 1966, 58

TOPIC TAGS: gas burner, gas combustion

ABSTRACT: The proposed gas burner contains perforated pipes for the gas supply which are located above a longitudinal exit slot of an air duct. In order to ensure a con-

TITLE: Investigation of the System Antimony - Tellurium

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 11,
pp 2525 - 2530 (USSR)

ABSTRACT: The phase diagram of the system Sb - Te was investigated by various scientists several years ago. The data disagreed. Publications by N. S. Konstantinov, and V. I. Skirnov (Ref 6), S. A. Semiletov (Ref 10), and F. I. Vasenin (Ref 12) are mentioned in a short survey (Refs 1-12). The method of melt preparation is briefly described, and it is especially pointed out that the melts are equilibrated not before they have been annealed for several hours at temperatures somewhat below the solidus. Thermal analysis was made by means of N. S. Kur-nakov's pyrometer; the samples were sealed in Stepanov ampules. The thermoelectric force was measured on a PPTV-1 potentiometer. Figure 1 shows the phase diagram according to data available so far in publications; figure 2 shows the diagram corrected by the authors. The solid solution of Te in Sb the α -phase, attains a maximum content of Te (1%) at 500°. The

Card 1/2

Investigation of the System Antimony - Tellurium

05869

SOV/78-4-11-22/50

homogeneous range of the β -phase is found within the range 18-38% of Te. The β -phase is formed by maximum saturation with Sb due to a peritectic reaction at 550° , by a peritectic reaction at 548° on maximum saturation with Te, and at 32% of Te it passes through a minimum in the melting diagram at 538° . Melts in the homogeneous range of the β -phase exhibit a distinct polyhedral structure (Fig 3a). The γ -phase resulting from peritectic reaction at 558° is found between 42-55% of Te. The δ -phase (Sb_2Te_3) crystallizes directly out of the liquid at 616° and a Te content of 60.3%, and contains 61.1% of Te which is a little more than would correspond with the stoichiometric ratio. The positive kind of conductivity found also by other scientists is to be ascribed to this tellurium excess (Fig 5). The β -, γ -, and δ -phase were also shown by X-ray analysis (Fig 4, Table 1). There are 5 figures, 1 table, and 13 references, 6 of which are Soviet.

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye khimicheskikh nauk, no. 11, 1962, 2078-2079

TEXT: The nucleophilic addition of 1,1-dinitropropane, 1,1-dinitrobutane to β,β,β -trinitroethyl acrylate was examined in order to ascertain the reactivity of the double bond in acryl esters of nitro-alcohols. The reaction at room temperature in methanol and in the presence of catalytic amounts of sodium methylate resulted in the following compounds: (1) The 2,2,2-trinitroethyl ester of γ,γ -dinitrocaproic acid was obtained from 1,1-dinitropropane and 2,2,2-trinitroethyl acrylate; m.p. 53-54°C; yield 35.1%; (2) the 2,2,2-trinitroethyl ester of γ,γ -dinitroanthic acid was obtained from 1,1-dinitrobutane and 2,2,2-trinitroethyl acrylate; m.p. 69-70°C, yield 17.3%. For comparison, the same gem-dinitroalkanes were added to 1-nitroalk-1-enes, whereby the following compounds were obtained for the first time: (1) 1,3,3-trinitro-2-methyl pentane,

TOPIC TAGS: organic nitro compound, aliphatic carboxylic acid, chemical reaction, dissociation constant, heat resistance

ABSTRACT: γ -nitro- and γ -nitro- γ -methylpimelic acid were synthesized from methyl acrylate and nitromethane (nitroethane). The dihydrazides and the dichloroanhydrides were prepared. Introduction of the nitro groups in the γ -position of pimelic acids reduced their thermal stability. Dissociation constants determined by potentiometric titration showed that introduction of 1 or 2 nitro groups in the γ -position of pimelic acid increased acid strength. Acid strength increases in the following

 TITLE: Addition kinetics of trinitromethane to acrylic acid in water
 SOURCE: AN SSSR. Izv. Ser khim, no. 7, 1966, 1138-1145
 TOPIC TAGS: trinitromethane, acrylic acid, addition reaction, addition kinetics, addition rate, NITROMETHANE, SPECTROPHOTOMETRIC ANALYSIS
 ABSTRACT: The addition kinetics of trinitromethane (TNM) to acrylic acid (AC) in water has been studied spectrophotometrically from the changes in TNM and 4,4,4-trinitrobutyric acid (TNB) concentrations. To suppress the dissociation of AC, the experiments were conducted in HCl media with $pH \approx 2$. Addition of water to the double band of AC was disregarded. The effective constants of the addition rate of TNM to AC were calculated for different initial ratios of the reactants. In all experiments the values of the effective constants of the second-order reaction rate were close (the value of $K_{eff} \times 10^2$ varied from 3.33 to 3.59 $l \cdot mol^{-1} \cdot min^{-1}$). From the results obtained it was concluded that addition of TNM to AC is a second-order reaction which proceeds in three steps

TITLE: Electronographic investigation of phase formation in binary Pd-S and Pd-Se layers

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 12, 1961, 51, abstract 120361 (Dokl. AN AzerbSSR, 1961, v. 17, no. 4, 279 - 281, Azerb. summary)

TEXT: The method of fast electrons (V 60 - 70 kv) was employed to study conditions of phase formation in binary Pb-S and Pb-Se layers. Thin layers, about 300 - 600 Å thick, were obtained by consecutive evaporation and condensation of elements on a celluloid backing in a vacuum of about 10^{-5} mm Hg. The specimens obtained were investigated both prior to and after annealing at about 120°C during 5 - 20 minutes. It is shown that during the deposition of Pb on Se and Se on Pb, a PbSe compound is formed. Annealing does not entail changes in the phase composition. During the deposition of Pb on S the PbS compound is formed without annealing, while during S deposition on Pb, the PbS phase is not formed.

without annealing, S deposited on a celluloid backing proved to be amorphous, and crystalline when deposited on Pb. It is assumed that this is caused by the effect of the nature of the backing.

TITLE: Phase transformations in thin Ni-Se layers

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 143, no. 1, 1962, 95 - 96

TEXT: By means of electron diffraction studies it can be proved that if Ni and Se from two different sources are condensed simultaneously onto backings the system Ni-Se forms NiSe_2 , NiSe (β -modification), and Ni_3Se_2 according to the concentrations of the components. No γ -modification of NiSe was observed. The phase formation and the phase transformations of Se double layers on Ni were studied on a series of photographs (3 pictures within 12 minutes at temperatures between 20 and 400°C). In the condensation of Se on Ni NiSe_2 arises in the form of fine crystals. At temperatures above 150°C NiSe_2 passes into β - NiSe , which is the only phase existing above 300°C. On further heating in vacuo this phase gradually passes into Ni_3Se_2 . The following scheme is given:
